ABSTRACTED-PUB-NO: JP07060832A

BASIC-ABSTRACT: Film contains aggregated alpha-alumina particles having a prim. particle size of 10-200 nm., an average particle size of 50-600 nm., and a particle density of 3.4-4.0 g/cm³.

The film opt. further contains aggregated particles (A) of gamma-alumina, delta-alumina, theta-alumina, zirconia, silica and/or titanium. It may have a two or more layer structure, in which the aggregated alpha-alumina particles are contained in the outermost layer and may contain mono-dispersed particles (B).

The mono-dispersed particles are pref. calcium carbonate, colloidal silica, titanium oxide and/or organic particles.

USE/ADVANTAGE - Used for magnetic recording media. The film is prevented from being damaged and has high image properties and drop-out properties. The polymer for the film is polyethylene terephthalate.
